Understanding and Treating Depression

By The National Alliance
on Depression

Everyone experiences low mood at one time or another, but for some people, it can become a chronic condition. Depression is a complex mental health condition that can affect anyone, regardless of age, gender, or background. It is a medical condition that can be treated, but it is not always understood or taken seriously.

Antidepressants: A Complicated Picture

By Thomas D. Reed, MD, Director
The National Alliance
on Depression

Antidepressants are a class of drugs that are used to treat depression. They are often prescribed by doctors, but there is a lot of controversy surrounding them. Some people believe that they are effective, while others believe that they are not. The truth is, it's complicated.

and Treating Depression

Depression is a common mental health condition that affects millions of people. It is a complex condition that can be difficult to diagnose and treat. However, there are several strategies that can help people manage their depression and feel better.

There are several signs of depression that people should be aware of. These include feeling sad or hopeless, losing interest in activities, changes in sleep or appetite, and thoughts of death or suicide. If you experience these symptoms, it is important to seek help from a healthcare professional.

There are several strategies that can help people manage their depression. These include getting regular exercise, eating a healthy diet, getting enough sleep, and talking to a healthcare professional. It is also important to avoid alcohol and drugs, as these can worsen depression.

As the weather changes, many people experience a change in their mood. This is often due to the changes in the amount of sunlight that they receive. This is a common experience that is often referred to as seasonal affective disorder (SAD). SAD is a type of depression that is related to the changes in the amount of sunlight that people receive during the winter months. It is a type of depression that is often treated with light therapy.

There are several signs of SAD that people should be aware of. These include feeling sad or hopeless, losing interest in activities, changes in sleep or appetite, and thoughts of death or suicide. If you experience these symptoms, it is important to seek help from a healthcare professional.

There are several strategies that can help people manage their SAD. These include getting regular exercise, eating a healthy diet, getting enough sleep, and talking to a healthcare professional. It is also important to avoid alcohol and drugs, as these can worsen SAD.

Depression and anxiety double for teenagers

By Tom Rawden

Depression and anxiety have more than doubled among teenagers during the lockdown, a study has found.

Depression and anxiety have more than doubled among teenagers during the lockdown, a study has found.

"We've all been worried for the lockdown, but children and their parents, in particular with school closures have really been affected. There might be short-term effects but if they persist they could be long-term. It's a big worry."

Image ID: 2550344

A study published in the journal *Journal of Child Psychology and Psychiatry* found that the prevalence of depression and anxiety among teenagers in the UK has more than doubled since the start of the COVID-19 lockdown. The study, which involved a survey of over 10,000 teenagers, found that the prevalence of depression had increased from 10% to 22%, and the prevalence of anxiety had increased from 15% to 32%. The researchers also found that the increase in depression and anxiety was most pronounced among girls, and among teenagers who had experienced significant changes in their lives since the start of the lockdown, such as moving to a new school or losing a loved one. To avert suicide, one needs to fight against depression

Around 80% Punjabis Are Not Getting Treatment For Depression

Depression is a global health problem that affects millions of people worldwide. It is a leading cause of disability and a major contributor to the global burden of disease. In India, the prevalence of depression is estimated to be around 10-15% in the general population. However, the actual prevalence is likely to be much higher due to underreporting and lack of awareness.

Depression is a complex condition that can affect anyone, regardless of age, gender, or social status. It is characterized by persistent feelings of sadness, loss of interest in activities, and changes in sleep and appetite. If left untreated, depression can lead to serious complications, including physical health problems and even suicide.

According to WHO, the average suicide rate in India is 24.5 per one lakh people. Though suicide rates have declined globally, they have increased in India. Day set aside to find depression sufferers

Emphasis on referring those with symptoms to counselors, doctors

Colorado Springs, Colo. — Depression and manic-depression are the common causes of mental illness, striking more than 17 million Americans each year.

But fewer than half of those struck seek treatment — usually psychotherapy and/or medication — which can be up to 90 percent effective. So in 1990, Harvard psychiatrist Douglas Jacobs launched National Depression Screening Day as a complement to National Mental Illness Awareness Week.

This year's screening day is Thursday.

Although only a handful of local counseling services are participating this year, they'll refer clients to mental-health resources throughout Colorado Springs, said Randy Remarchuk, a counselor with WinWin Solutions.

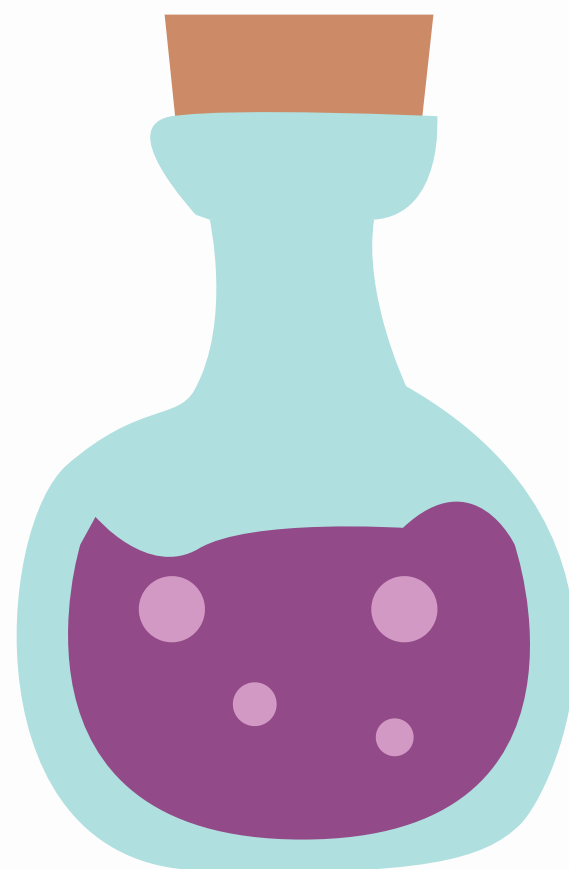

This year, the said, increased emphasis will be on identifying manic-depression, a disorder in which periods of euphoria and agitation
